Utilizing the “True Color” profile on HP FI-1000 Printhead

The True Color profiles provided by iJetColor allow direct CMYK printing on select jobs. If a job has a CMYK color that is created as 100% of a CMYK color, it will use just the respective HP FI-1000 ink channel to print that color.

For example, if a created color is 100% yellow and no other added colors, it will print the yellow artwork using the HP FI-1000 yellow ink channel. If the yellow artwork is created with 80% Yellow, True Color does not apply, and it will print the yellow as a 4-color build.

Compared to previous profiles, the new True Color can provide more vibrant colors by providing direct CMYK color output. However, for True Color to print directly from the HP FI-1000 CMYK ink channel for a respective color, that CMYK color must be set up as 100% with no other added colors. It is also only applicable if the created color is 100% Cyan, Magenta, Yellow, or Black as those are the ink channels on the HP FI-1000 printhead.

True Color can be selected from the Color Paper drop-down options in the Full Job editor.
